

No learned parameters: every step is computed from the data.

Toy: 14 genes, 60 samples, planted modules; $k_{eff} = 3$, top 5, t = 1, 3, 9 (real method: 10, 50, 9).

Curves: normal fits (mean, sd) of the row's 14 values (ticks). Light = low, dark = high; grey diagonal = self, excluded.
