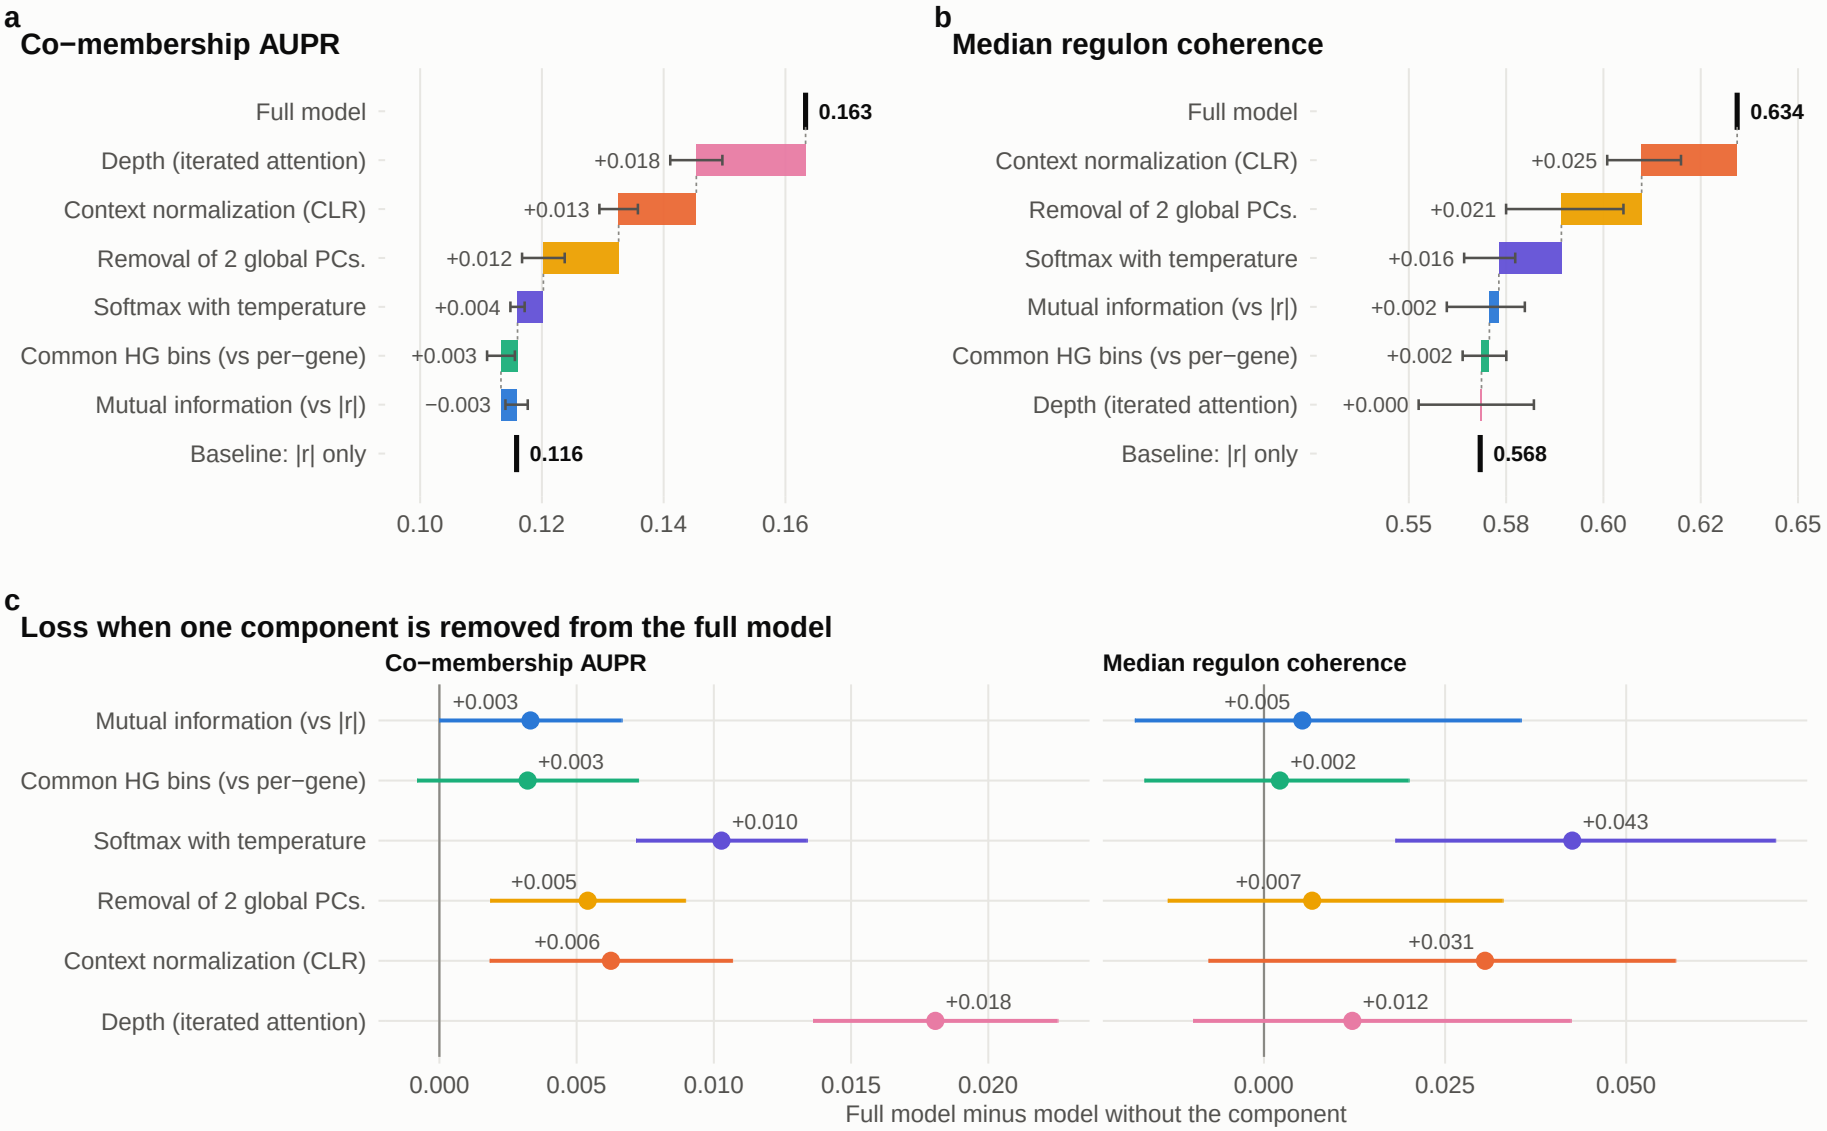
## What each component of completed CLR attention contributes

M3D, 466 experiments; RegulonDB strong/confirmed evidence. Exact Shapley values over all 64 on/off combinations of six components; whiskers 95% intervals (gene jackknife for AUPR, regulon bootstrap for coherence).



. PC removal was chosen after inspecting Supplementary Note 7 and is not part of the main pipeline. Depth at t = 9; 'off' alternatives: |r|, per−gene Freedman−Diaconis bins, raw dependence, hard top−10 neighbours, no attention, no PC removal.
