CLR as attention: compendium in, gene-association map out

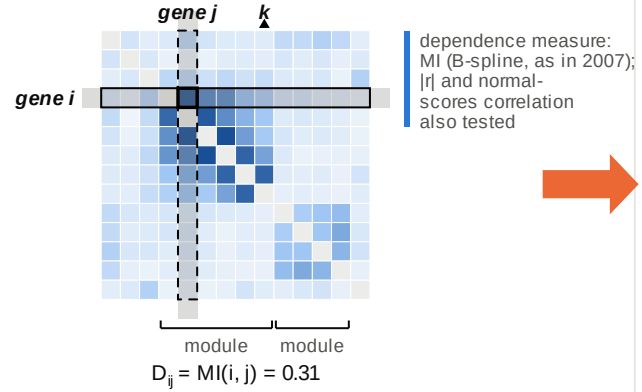

WORKED EXAMPLE (TOY): not results

1 Dependence

MI (B-spline, as in CLR 2007)

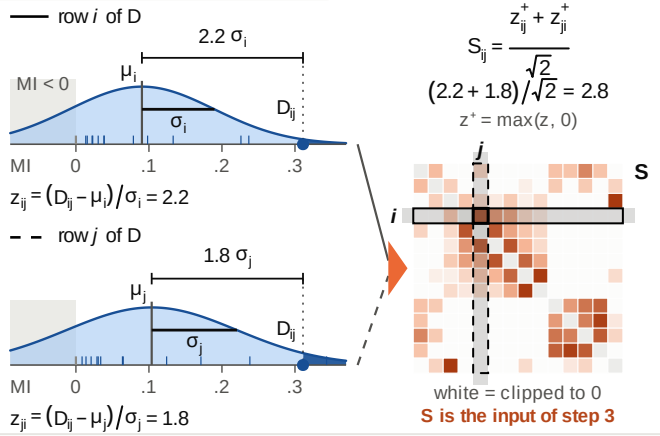

pairwise compatibility (parameter-free, symmetric)

2 Per-gene calibration (CLR)

z-scores clipped at 0; pair combined by Stouffer

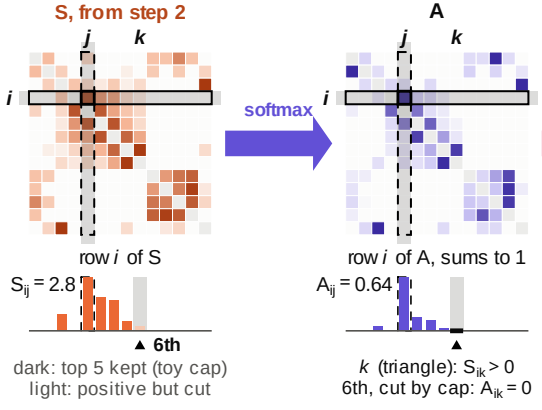

per-query normalization of the logits

3 Softmax attention

added here

softmax over the keys, temperature per query

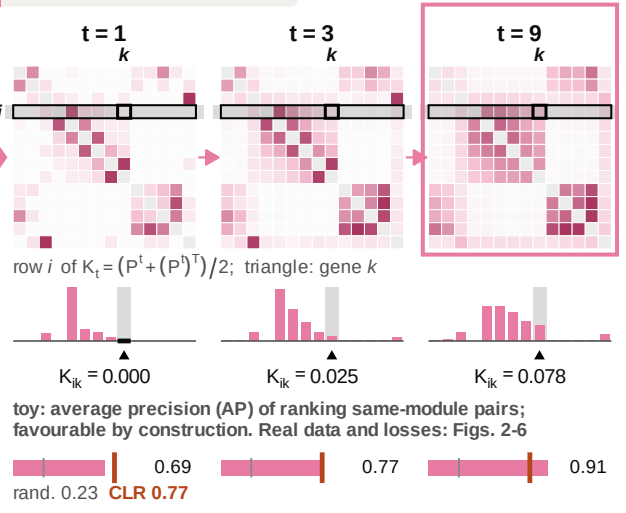

4 Walk: depth

added here

repeated attention with residual

P = 0.5I + 0.5A, repeated t times

Toy example; analogy with transformer attention, not equivalence; no real-data result shown.
