## Mixing platforms creates the ‘Christmas tree’ and dilutes a known LexA–target relationship

lexA against two SOS genes it represses (rows). In M3D the relationship is monotonic and the SOS-induced arrays extend it. Pooled EcoMAC arrays split into platform clouds at different heights, so r and MI fall well below M3D; Genome 2.0 arrays alone (1 DNA-damage array of 735) show only a weak relation. 'No GEO record': 619 EcoMAC arrays (M3D/ASAP chip ids) without a GEO series, so their platform could not be looked up.

Dashed ellipse: 90% normal ellipse of arrays annotated with a DNA-damaging treatment (quinolone, mitomycin C, UV or nalidixic acid). MI: B-spline estimator with shared histogram bins.
